

New Tools for Water Quality Data Access, Trend and Load Analysis

An overview of the USGS R Packages:

dataRetrieval and EGRET

Robert M. Hirsch

USGS

2014-10-07

dataRetrieval

Retrieves water data for use in R

Some functions designed specifically as inputs to EGRET

EGRET: Exploration & Graphics for RivEr Trends

Flow history analysis

Water quality graphics

WRTDS: Weighted Regressions on Time Discharge & Season: for water quality trends and fluxes

WRTDS for exploration

These packages have been a joint effort for 3 years

- Laura De Cicco of the CIDA group in Wisconsin is the primary author of dataRetrieval and has made huge contributions to all aspects, including trying to retrain a “Paleo Code Writer”
- Also thanks to our colleague reviewers: Jeff Chanat, VA WSC and Jessica Thompson, WI WSC
- Crucial support from OWQ, NAWQA, OWI, and CIDA

Outline

Motivations for the packages

The WRTDS concept and examples of results

Overview of dataRetrieval

How EGRET works, doing WRTDS analysis and producing graphs and tables

From Ralph Keeling

The only way to figure out what is
happening to our planet is to
measure it,

and this means tracking changes
decade after decade

and poring over the records.

Keeling, 2008, Recording Earth's vital signs, Science, p1771-1772

**Models without data are fantasy,
but data without models are chaos**

**How do we come to understand what
is happening to water quality in
large watersheds.**

Is it getting better or worse?

**Can we develop ideas of causative
factors and changes in processes?**

**Can these be used to guide
management choices?**

Motivations for the method

- Describe the evolving behavior of the watershed. No mathematical straight-jacket!!
- Estimate both concentration & flux (averages as well as trends).
- Estimate the actual history but also a flow-normalized history.
- Resolve a serious bias in flux estimates.
- Be quantitative but also exploratory.

Data requirements

- Low intra-day variability (not flashy)
- Requires a complete daily discharge record
- Intended for >200 samples, but has been used for some purposes with as few as 60 samples
- Water quality samples cover most of the discharge range
- For trend studies: 20+ years, but can do less
- For average flux computations: 5 – 10 years.

**Choptank,
293 km²
watershed**

“Data without models are chaos, but models without data are fantasy”

Nesbit, Dlugokencky and Bousquet, Science, 31 January 2014, pp. 493-495

Use the data and a simple, highly-flexible smoothing model to decompose the data into 4 components.

1) Discharge related component

2) Seasonal component

3) Time trend

4) Random component

**Weighted Regressions on Time,
Discharge and Season (WRTDS)**

Locally Weighted Regression

For any location in time - discharge space (t and Q) we assume that concentration (c) follows this model

$$\ln(c) = \beta_0 + \beta_1 \bullet t + \beta_2 \bullet \ln(Q) + \beta_3 \bullet \sin(2\pi t) + \beta_4 \cos(2\pi t) + \varepsilon$$

But the coefficients should be smoothly changing as we move through the space

Use weighted regression at many points in that space. The weight on each sample is determined by its “relevance” to that particular point in the space.

WRTDS view of the evolving behavior of nitrate

Choptank River near Greensboro, MD Nitrate plus Nitrite, Filtered, as N
Estimated Concentration Surface in Color

How is this surface created?

Every dot is a data point from 1993 to 2012
Let's say we want to use the data to estimate the
expected value of concentration for January 1,
2003 at Q=500 cfs

The principle is this:

Do a weighted regression at this point. The weights on each observation are related to their “distance”

Distance in time, in $\log(Q)$, and season.

Now move to the next point and do it all over again.

This kind of weighted regression gets done about 6000 times to form this whole surface!!

You must be kidding. This is a ton of computations!!
That's right! But it's what we need to make order out of chaos.

How do we set the weights for the regression?

These are the same points we just saw, but the radius of the dot is proportional to weight assigned to that point for purposes of estimating concentration for January 1, 2003 at $Q=500$ cfs

The weight depends on distance in: time, log discharge, and season from January 1, 2003 at $Q = 500$ cfs

Choptank River near Greensboro, MD Nitrate plus Nitrite, filtered, as N
Locations of all available data

**What if we wanted to make an estimate
for January 1, 2003 but for $Q = 50$ cfs
Redo the weights for distance from
that point**

**To organize the work, lets make estimates
for a fine mesh of points in this space.
We will do it at 14 Q values and 177 time
values, for a grid of 2,478 points.**

Choptank River near Greensboro, MD Nitrate plus Nitrite, filtered, as N
Locations of all available data

Here are two, more detailed looks at this surface

Choptank River near Greensboro, MD Nitrate plus Nitrite, Filtered, as N
Estimated Concentration Surface in Color

Now, for every one of 10,227 days in the record from 1985 through 2012:

We can use the date and the observed discharge to compute the expected value of concentration.

From that value we can compute the expected value of flux.

Then we can sum these estimates by year to compute estimates of annual mean concentration & annual mean flux

Choptank River near Greensboro, MD

Nitrate

Observed and Estimated Concentration versus Time

Choptank River near Greensboro, MD

Observed and Estimated Flux versus Time

Choptank River near Greensboro, MD Nitrate

Water Year

Annual Mean Concentration

Choptank River near Greensboro, MD Nitrate

Water Year

Annual Flux Estimates

Can we filter out this flow-driven variation to see the underlying change?

**The “flow normalized concentration” on any given day is:
 $c=f(Q,T)$ integrated over the probability distribution of Q
for that day of the year.**

**Flow normalized flux is just $c \times Q$ integrated over
discharge.**

**Sum those over the year to get annual flow-normalized
mean concentration and flux.**

Choptank River near Greensboro, MD Nitrate
Water Year

Mean Concentration (dots) & Flow Normalized Concentration (line)

Choptank River near Greensboro, MD Nitrate
Water Year

Flux Estimates (dots) & Flow Normalized Flux (line)

Hints that rates of increase have slowed?

Look at changes in just the last few years.

This is a graphic of differences 2007 to 2012

Choptank River near Greensboro, MD Nitrate plus Nitrite, Filtered, as N
Estimated Concentration change from 2007 to 2012

Hypothesis, cover crops are helping at higher flows particularly in the winter. Low flows are still responding to legacy of nitrate enriched groundwater.

Why all this complexity?

Different products for different purposes

- Concentration versus flux
- Actual history versus flow-normalized history

For understanding impact on the estuary ecosystem

We want the flux history

For understanding progress in the watershed

We want the flow-normalized flux history

For understanding the
changes in the rivers

dataRetrieval

- Brings data from various sources into R
- Organizes it
- Some of the functions organize for EGRET uses

dataRetrieval functions:

By information source and purpose

Information Source	Site Query	Meta Data	Data
NWIS			
Water Quality Portal			
User-supplied files			

dataRetrieval functions:

By information source and purpose

Information Source	Site Query	Meta Data	Data
NWIS	getNWISSites getNWISDataAvailability	getNWISInfo getNWISSiteInfo getNWISPcodeInfo	getNWISData getNWISDaily getNWISSample getNWISdvData getNWISunitData getNWISqwData
Water Quality Portal	getWQPSites	getWQPInfo	getWQPSample getWQPqwData getWQPData
User-supplied files		getUserInfo	getUserDaily getUserSample

Those functions shown in red are designed specifically to provide data frames suitable for use by the EGRET package

dataRetrieval

- Can acquire data from web services (USGS or the Water Quality Portal) as well as from user-supplied files
- Includes capability for sample data, daily discharge, other daily values, sensor data, and meta data about site and parameter
- Structures the data to be conveniently used by the EGRET software

Getting Started

- Need to install R (freely downloaded from <http://cran.us.r-project.org/>)
- Next install the EGRET & dataRetrieval packages per the instructions on our wiki page.

<https://github.com/USGS-R/EGRET/wiki>

Will soon be on CRAN (Contributed Packages) ☐

Getting Started 2

- Then each time packages are used, they need to be loaded, using the commands
`library(dataRetrieval)`
`library(EGRET)`
- Once this is done you will have access to help and to the package vignettes.
- To get help with a function (such as the function `getNWISSample`) just type `?getNWISSample`

How can we enter data

- **For the water quality sample data**
 - From USGS web services
 - From Water Quality Portal (for STORET)
 - From a user supplied file
- **For the daily discharge data**
 - From USGS web services
 - From a user supplied file
- **For the meta-data**
 - From USGS or Water Quality Portal
 - From user entries

```

> library(dataRetrieval)
> library(EGRET)
> siteNumber <- "01491000"
> parameterCd <- "00631"
> startDate <- "1979-10-01"
> endDate <- "2014-09-28"
> Sample <- getNWISSample(siteNumber,parameterCD,startDate,endDate)
> summary(Sample)

```

```

> Sample<-getNWISSample("01491000","00631","1979-10-01","2014-09-28")
> summary(Sample)

```

```

Censored values

All concentration data are treated as intervals.

- Let's say reported concentration is 1 mg/L
- We code this as: `ConcLow = 1.0` and `ConcHigh = 1.0`
- The interval for this data point is then 1.0 to 1.0

- For a value reported as “less than 1.0 mg/L”
- We code this as: `ConcLow = NA` and `ConcHigh = 1.0`
- The interval for this data point is then 0.0 to 1.0

All of the “weighted regressions” in WRTDS are really “survival regression” (the function `survreg` in R) which is design for data reported as an interval.

Censored values and compound analytes

Sometimes an analyte of interest is the sum of two or more measured analytes. Here is a real example for Total Nitrogen in the Susquehanna River, Maryland, April 27, 1988.

- The rule is: Compute Total N as Ammonia plus organic N, unfiltered + Nitrate plus nitrite, filtered

The two analyte values were reported as <0.2 and 0.9 mg/L respectively. Therefore, this data point has $\text{ConcLow} = 0.9$ and $\text{ConcHigh} = 1.1$.

- The conventional left-censored approach calls this $(0, 1.1)$
- WRTDS calls this $(0.9 \text{ to } 1.1)$

EPA Storet Data from the Water Quality Portal

Storing the metadata

- For NWIS data `INFO<-getNWISInfo(siteNumber,parameterCD)`
- Similar function for the Water Quality Portal
- The contents of `INFO` are used to label tables and figures as well as document the site and constituent information
- Creates a system of abbreviations to keep track of **workspace** files

```
> INFO<-getNWISInfo(siteNumber,parameterCd)
```

Your site for streamflow data is 01491000 .

Your site name is CHOPTANK RIVER NEAR GREENSBORO, MD ,but
you can modify this to a short name in a style you prefer.

This name will be used to label graphs and tables.

If you want the program to use the name given above, just
do a carriage return, otherwise enter the preferred short
name(no quotes):

<cr>

The latitude and longitude of the site are: 38.99719
, -75.78581 (degrees north and west).

The drainage area at this site is 113 square miles
which is being stored as 292.6687 square kilometers.

It is helpful to set up a station abbreviation when
doing multi-site studies, enter a unique id (three or
four characters should work).

It is case sensitive. Even if you don't feel you need
an abbreviation for your site you need to enter
something (no quotes):

Chop

Your water quality data are for parameter number 00631 which has the name: ' Nitrate plus nitrite, water, filtered, milligrams per liter as nitrogen '.

Typically you will want a shorter name to be used in graphs and tables. The suggested short name is: ' Nitrate-nitrite '.

If you would like to change the short name, enter it here, otherwise just hit enter (no quotes):

Nitrate, filtered, as N

The units for the water quality data are:
mg/l as N .

It is helpful to set up a constituent abbreviation when doing multi-constituent studies, enter a unique id (three or four characters should work something like tn or tp or NO3).

It is case sensitive. Even if you don't feel you need an abbreviation you need to enter something (no quotes):

no3

If you are using supplied data, you still must run the command:

```
> INFO <- getUserInfo()
```

The program will then prompt you to enter metadata about your site and study.

All metadata is voluntary except the following required fields:

- A site name
- A parameter name
- A site abbreviation
- A parameter abbreviation

Two more commands before we can start our analysis of the data

```
> Sample<-mergeReport()
```

```
> Sample<-mergeReport()
```

```
Discharge Record is 12782 days long, which is 35 years
```

```
First day of the discharge record is 1979-10-01 and last day is 2014-09-28
```

```
The water quality record has 708 samples
```

```
The first sample is from 1979-10-24 and the last sample is from 2014-08-13
```

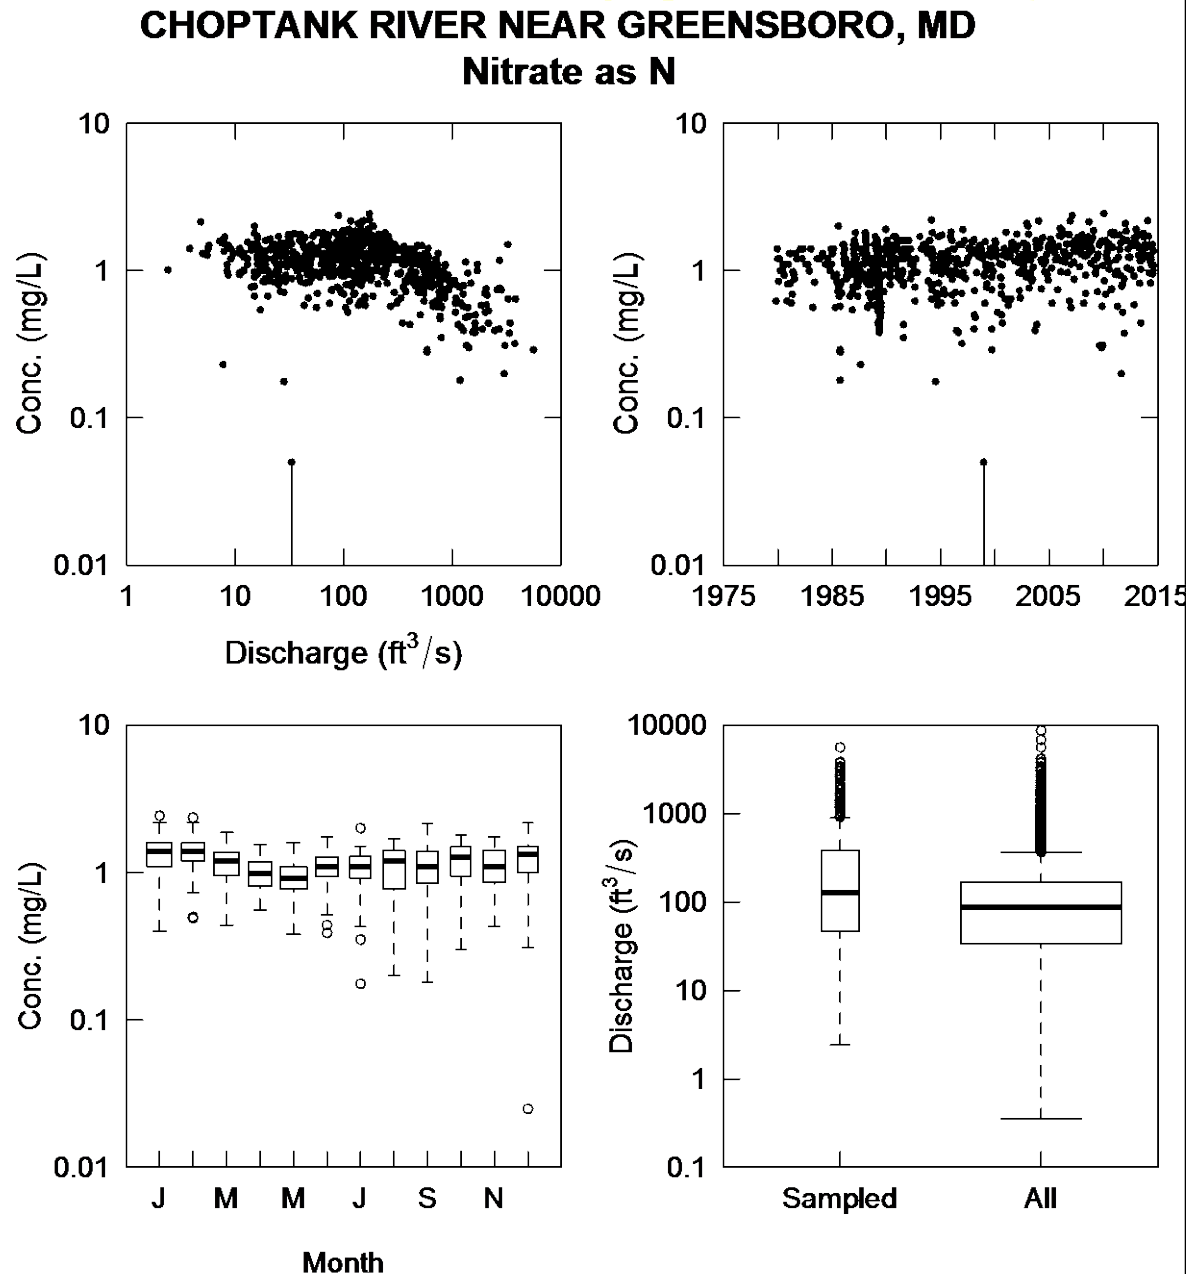

```
Discharge: Minimum, mean and maximum 0.00991 4.17 246
```

```
Concentration: Minimum, mean and maximum 0.05 1.1 2.4
```

```
Percentage of the sample values that are censored is 0.14 %
```

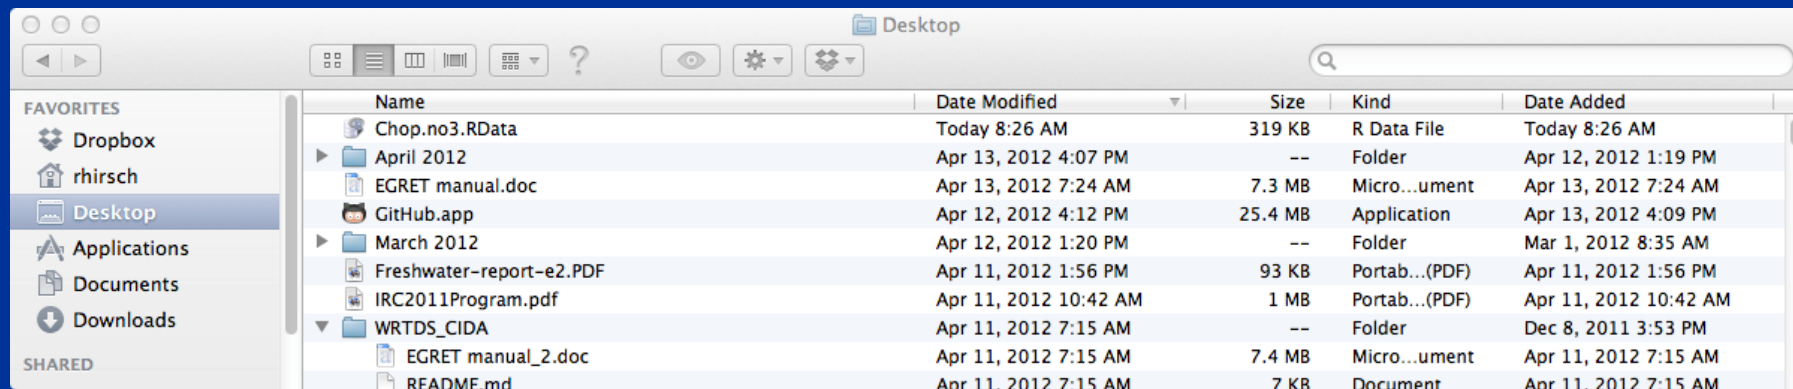

> multiPlotDataOverview(qUnit=1)

Let's look at the data before we proceed, the function is:

We've gone to all this effort, let's save our work

```
> savePath<-"~/Users/rhirsch/Desktop/"  
> saveResults(savePath)
```

Chop.no3.RData

Save it over and over as
you proceed and add
results

We now have 3 data frames

- **Sample (708 rows, 14 columns)**
- **Daily (12,782 rows, 12 columns)**
- **INFO (1 row, 53 columns)**

A short digression into other things you can do with dataRetrieval, not related to EGRET

Unit values retrieval (not used by EGRET)

- Raccoon River at Van Metre, IA
- Nitrate sensor data
- March – Sept 2013

```
> Unit<-getNWISunitData("05484500",parameterCd=c("99133","00060"),"2013-03-01","2013-09-30")

                 xaxt="n",yaxt="n",axes=FALSE,ylab="",xlab=""))
> axis(4,col="red",col.axis="red")
> mtext("Discharge",side=4,line=3,col="red")

```

Many options for graphics and modeling of concentration and discharge together. Not a part of EGRET – but it must be in a next generation of EGRET!

Now back to what is in EGRET

- This is where EGRET estimates the WRTDS model and applies it

> modelEstimation()

- Runs the model in cross-validation mode
- Estimates the “surface” for concentration as a function of time and discharge
- Uses the surface to compute daily values of
 - Concentration
 - Flux
 - Flow-normalized concentration
 - Flow-normalized flux
- Adds those to the Daily data frame

User has choices about some of the parameters of the WRTDS model

Now what is in Daily?

It is a data frame that has dimension (12782, 19)

```
> summary(Daily)
```

“Period of Analysis” concept in EGRET.

- Could be water year
- Could be calendar year
- Could be April-May-June
- Could be Dec-Jan-Feb-Mar
- Could be only May...

paStart = calendar month that starts Period

paLong = length of Period, in months

Period of analysis set up

Say we want calendar year

```
INFO <- setPA(paStart = 1, paLong=12)
```

Say we want April, May, June

```
INFO <- setPA(paStart = 4, paLong = 3)
```

Default is water year

Units in EGRET

Everything stored as:

m^3/s , kg/day , or mg/L

But each graphic or table has a wide choice of units (English and SI) that the user can select

Now lets see some trend results

```
> plotConcHist()
```

CHOPTANK RIVER NEAR GREENSBORO, MD Nitrate as N
Water Year

Mean Concentration (dots) & Flow Normalized Concentration (line)

> plotFluxHist(fluxUnit=8)

```
> INFO <- setPA(paStart=3,paLong=4)  
> plotFluxHist(fluxUnit=8)
```

```
> tableResults(qUnit = 1, fluxUnit = 5)
```

CHOPTANK RIVER NEAR GREENSBORO, MD

Nitrate as N

Water Year

Year	Discharge cfs	Conc	FN_Conc mg/L	Flux tons/yr	FN_Flux
1980	150.2	0.926	0.953	125.5	117
1981	78.3	1.004	0.963	72.6	119
1982	107.6	1.017	0.972	107.0	121
1983	176.1	0.998	0.984	144.4	124
1984	201.9	0.988	0.997	173.9	126
1985	53.6	1.055	1.011	53.8	129
1986	92.8	1.050	1.023	98.9	132
1987	119.1	1.064	1.043	124.7	135
1988	66.0	1.121	1.079	72.4	139
.					
.					
.					
2007	151.2	1.395	1.373	177.1	168
2008	90.5	1.459	1.386	112.8	169
2009	130.0	1.404	1.402	147.9	170
2010	254.0	1.310	1.417	256.4	172
2011	185.2	1.417	1.431	179.0	174
2012	122.6	1.480	1.445	157.1	175
2013	226.0	1.376	1.460	241.1	177
2014	191.8	1.411	1.475	233.0	179

```
> tableChange(fluxUnit=5,yearPoints=c(1980,1995,2014))
```

CHOPTANK RIVER NEAR GREENSBORO, MD

Nitrate as N

Water Year

Concentration trends

time span			change mg/L	slope mg/L/yr	change %	slope %/yr
1980	to	1995	0.25	0.017	26	1.7
1980	to	2014	0.52	0.015	55	1.6
1995	to	2014	0.27	0.014	23	1.2

Flux Trends

time span			change tons/yr	slope tons/yr /yr	change %	slope %/yr
1980	to	1995	33	2.2	29	1.9
1980	to	2014	62	1.8	53	1.6
1995	to	2014	29	1.5	19	1

Running tableChange for the March-June Period of Analysis shows a flux change from 1995-2014 of only 14%

I'm going to switch data sets to Nitrate for the Raccoon River at Des Moines Iowa

EGRET
produces a
diagnostic
plot to help
spot
serious
problems
with the
model

`fluxBiasMulti(fluxUnit=4)`

trate
Model is WRTDS Flux Bias Statistic -0.00237

**This same
type of plot
can be
used to
look at
other
models,
here the
LOADEST7**

fluxBiasMulti(fluxUnit=4)

n River at Des Moines, IA Nitrate
Model is L7 Flux Bias Statistic 0.319

Diagnostics and potential problems with estimating mean flux, see:

Hirsch, R.M., 2014, Large biases in regression-based constituent flux estimates: causes and diagnostics. Journal of the American Water Resources Association.

Bottom line, look at the fit before you use a statistical model!!!

How difficult is it to make those contour plots?

```
>plotContours(yearStart=1970, yearEnd=2005,  
qBottom=2, qTop=200, qUnit=2,  
contourLevels=seq(0,300,50))
```

There are many more graphics, for example

```
> plotConcQSmooth("1975-08-01", "1988-08-01", "2010-08-01", qLow=10, qHigh=300, qUnit=2, logScale=TRUE, legendLeft=100, legendTop=0.05)
```

> plotConcTime(qUnit=1,qUpper=50,paLong=8,paStart=6,concMax=2.5)

> plotConcTime(qUnit=1,qLower=200,paLong=5,paStart=12,concMax=2.5)

When all is said and done:

**The only way to figure out
what is happening to our
planet is to measure it,**

**and this means tracking
changes decade after decade**

and poring over the records.

Anticipated enhancements

- Significance levels and confidence intervals for trends
- Dealing with ephemeral streams
- Estimation of trends in frequency of exceedances of threshold values
- Dealing with nonstationarity in Q
- Improved estimates of yearly fluxes
- *Users ideas?*

dataDelivery and EGRET

- Information and software available at: <https://github.com/USGS-R/EGRET/wiki>

A huge thanks to
Laura De Cicco for
making this dream
a reality
